08**EXAMINER'S AMENDMENT**

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Kimton N. Eng, the applicant's attorney, on February 04, 2004.

IN THE CLAIMS:

- In claim 17, line 40, "a charge pump" has been changed to "a first charge pump".
- In claim 17, line 49, "a capacitor" has been changed to "a first capacitor".
- In claim 17, line 58, "a first phase detector" has been changed to "a third phase detector".
- In claim 17, line 65, "a second phase detector" has been changed to "a fourth phase detector".
- In claim 17, line 82, "a charge pump" has been changed to "a second charge pump".
- In claim 17, line 91, "a capacitor" has been changed to "a second capacitor".

Allowable Subject Matter

2. **Claims 17 – 22 are allowed, renumbered as 1 – 6, respectively.** The following is a statement of reasons for the indication of allowable subject matter:

Regarding to the claimed invention, the prior art of record fails to show or render obvious of a packetized dynamic random access memory comprising: a phase detector for generating a

Art Unit: 2631

control signal based on the phase relationship between two clock signals, which includes two phase detector circuits that each provide to a charge pump or a phase dependent signal source to select signals based on the phase relationship of the clock signals. The charge pump receives the select signals and produces a current output signal according to combination of the selected signals from the phase detector circuits. The current output signal may be converted into a control signal by connecting a capacitor to the output of the charge pump. Substantially and significantly, the phase detector produces a non-varying control signal when the two clock signals have a predetermined phase relationship as emphasized in claim 17. The control signal may be used to adjust the delay value of a voltage-controlled delay circuit to adjust the phase relationship between the two clock signals.

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Gans et al. (U.S. patent #. 6,438,043 B2) discloses an adjustable I/O timing from externally applied voltage.

Momtaz (U.S. patent # 5,945,855) discloses a high-speed phase locked loop having high precession charge pump with error cancellation.

Harrison (U.S. patent # 5,940,609) discloses a synchronous clock generator including a false lock detector.

Waizman (U.S. patent # 5,410,263) discloses a delay line loop for on-chip clock synthesis with zero skew and 50% duty cycle.

Koker (U.S. patent # 5,120,990) discloses a method and its corresponding apparatus for generating multiple phase clock signals and phase detector therefor.
